

Brainstorming & Ideation

FitBuddy – AI Fitness Plan Generator using Gemini Models

Project Context

FitBuddy is a web-based AI fitness planning application intended to generate personalized 7-day workout plans and a nutrition or recovery tip from user-provided fitness information.

The concept also supports feedback-based refinement of the generated plan.

Problem Identified

Users may find it difficult to create a structured workout schedule that matches their fitness goal and preferred intensity.

A static plan may not reflect changing user preferences, so FitBuddy includes a feedback-based update flow.

Ideas Considered

- Personalized workout-plan generation
- Goal-specific nutrition or recovery guidance
- Feedback-based modification of an existing workout plan
- Persistent storage of users and plans
- Administrative view of users and plans

Selected Idea

FitBuddy – AI Fitness Plan Generator using Gemini Models.

The selected concept combines generative AI, a web interface, backend API routes and database persistence.

Expected Outcome

- User enters name, user ID, age, weight, fitness goal and workout intensity.
- System generates a structured 7-day plan and nutrition/recovery tip.
- User can submit feedback and receive an updated plan.
- User and plan information can be stored and viewed.
